

A stacked fraction is two baselines with a rule between them, and on the page it means one quantity.

$$\frac{12}{116}$$

The numerator is a sum, so the solidus form needs it bracketed.

$$\frac{1+2}{3}$$

The denominator is a sum, and takes the brackets on the other side. Its bar is drawn at the same extent as the bar above it.

$$\frac{12}{3+4}$$

The rule below this paragraph divides nothing, and is the shape a fraction bar has.

It reaches far past both lines it sits between, where a bar is drawn for the expression it divides.
